Rectal foreign body[☆]

Cuerpo extraño rectal

U.G. Rossi*, S. Squarza, M. Cariati

Interventionist Radiology and Radiology Unit, Department of Diagnostic Science, ASST Santi Paolo y Carlo, San Carlo Borromeo Hospital, Milan, Italy

A 55-year-old man came to our emergency department due to acute abdominal pain. During the anamnesis, he stated having a foreign body—a vibrator—in his rectum. Abdominal examination revealed the presence of a mass at the level of the lower abdominal quadrants with no peritoneal signs. Digital rectal examination confirmed the presence of a foreign body. A conventional abdominal x-ray (Figure 1A) and an abdominal computed tomography scan (Figure 1B) demonstrated the presence of a vibrator in the rectosigmoid colon, and it was consequently extracted using a forceps and gentle traction. The post-removal sigmoidoscopy revealed no colorectal injuries.

It is common that patients that arrive at the emergency department with a foreign body in the rectum present with this situation due to transanal insertion of the object as a sexual practice. Rectal foreign bodies are more common in men than in women,^{1,2} and include such objects as vibrators, bottles, vegetables, fruits, cylindrical objects, and balls. These emergency department patients generally invent unusual stories to explain the presence of the object inside the rectum. Radiologic imaging is crucial for identifying rectal foreign bodies and determining the most appropriate treatment option.^{3,4}
